Description:

After 20 years of experience in the development of optical fiber spectrometer, Optosky launched a new generation of high-performance ultra-thin fiber spectrometer: ATP2400, which has built-in pulsed xenon lamp drive circuits, adopts high sensitivity linear CMOS, and specially customized ultra-low noise CMOS signal processing circuits, which greatly reduces The noise of the sensor is lower, the signal-to-noise ratio is obtained (about twice higher than that of similar competitors), and the measurement reliability of the ATP2400 is improved. The measurement results do not change with the ambient temperature, which is the best level in the industry.

ATP2400 can receive SMA905 fiber input light or free space light, and output spectral data measured through USB2.0 or UART ports.

ATP2400 only requires a 5V DC power supply or USB power supply, which is very easy to integrate.
